

To formalize the **KUTS Master Template**, I have consolidated operational requirements into a single, cohesive document that governs both the technical architecture and the social-industrial implementation of the **MDI6000 Project**.

This template serves as the "System Constitution" for all Anchor Nodes and MSME partners.

## **KUTS MASTER OPERATIONAL TEMPLATE: MDI6000**

### **1. Mission Objective: Aarohan 2050**

- **Purpose:** To transition industrial productivity into a physics-based, net-positive planetary mesh.
- **Core Mandate:** Deployment of the Kinetic Unified Temporal Synchronization (KUTS) system to professionalize and resource-manage Indian MSMEs.

### **2. Architectural Protocol Stack**

- **The Master Ledger (Temporal Anchor):** All activity is timestamped to the 22-digit KUTS serial string, anchored to the laws of physics.
- **Triple-Split Distribution:** Every kinetic transaction (pulse) is cryptographically partitioned at the point of origin:
  - **98%:** Kinetic Reward to the active Node/User.
  - **1%:** Infrastructure Tax (TDS) for system maintenance.
  - **1%:** Regenerative Tax (RSP) for biotic stewardship of the planetary biome.
- **Security Audit Protocol (SAP):** Autonomous verification of all logs against the Master Protocol hash to prevent manual bypass or speculative reporting.

### **3. Operational Workflow: The Daily Pulse**

Every node must follow this cycle to remain synchronized with the Genesis loop:

1. **Verification:** Initiate handshake with local Secondary Anchor Node.
2. **Transmission:** Log kinetic activity (Energy, Logistics, or Labor) via the Genesis Browser interface.
3. **Audit:** Allow the SAP engine to validate the input against physical sensor data.
4. **Finalization:** The ledger automatically executes the Triple-Split, updating the global Kine balance and the Biotic Regeneration Pool.

### **4. Governance: The Consensus of 144**

- Governance power is weighted by **Kinetic Proof of Witness (KPoW)** rather than capital.
- Nodes are categorized by their specific productive contribution (e.g., Mechanical [#00#], Biological [\00/], Neural [(00)]).

### **5. Biotic Stewardship (RSP)**

- The system functions as a **Net-Positive Industrial Mesh**.
- Ecological stewards (farmers/foresters) are co-equal producers to industrial nodes, minting credits through verified carbon sequestration and soil health metrics.

## Implementation Instructions

This template should be embedded into every new **Genesis Browser** instance deployed in the Thrissur-Tiruppur corridor. It serves as the primary reference for all operational teams to ensure systemic consistency across all nodes.
